

# Add a new SSH User

Laravel doesn't like it when you run it in root, this is for security purposes. We agree with them it's safer, however you can use root.

```
sudo useradd -m -d /home/ticaga demo
```

This creates a user called "demo".

```
sudo passwd demo
```

This allows you to create a password for the username "demo".

```
sudo usermod -aG wheel demo
```

This allows you to add the user "demo" to the sudo group, **this allows you to use sudo.**
