

Plugin Installation

To install the plugin simply download the plugin from: <https://github.com/ticaga/ticaga-whmcs>

Upload the **zip** to the **root of WHMCS** and extract the zip, move the files from **ticaga-whmcs-master**, and this will place all the files in the correct locations.

Afterwards head over to your WHMCS admin area, click on the **spanner**  in the top right and select **System Settings**.

The screenshot shows the WHMCS System Settings interface. At the top, there is a navigation bar with the WHMCS logo and various menu items: Clients, Orders, Billing, Support, Reports, Utilities, and Addons. A notification banner at the top left states: "The OPcache PHP extension is enabled. This extension can cause problems with cached data use and PHP script execution in WHMCS. We recommend disabling OPcache. Learn More." The main heading is "System Settings" with a sub-heading "Set up and configure your WHMCS installation." and a progress indicator showing 6% completion. On the right, there is a link "Click here to view the setup tasks". The left sidebar contains a search bar and a list of categories: All, System, Apps & Integrations (highlighted), User Management, Products & Services, Support, and API & Security. The main content area is titled "Apps & Integrations" and features a grid of six cards: "Apps & Integrations" (with an "UPDATED" badge), "MarketConnect" (with a "NEW SERVICE" badge), "Addon Modules", "Sign-In Integrations", "Notifications", and "Payment Gateways". A grey arrow points from the MarketConnect card to the Addon Modules card. Below the grid, there is a yellow banner with a "Dev License" warning. At the bottom, there are two more cards: "Domain Registrars" and "Application Links". The footer contains copyright information and links for "Report a Bug", "Documentation", and "Contact Us".

Click on **Apps & Integrations** and then **Addon Modules**.
